

NNX

WHITEPAPER 2.0

The Utility Layer for the AI & Data Economy

Connecting Data · AI · Digital Content · People

Ethereum ERC-20

Originally Deployed in 2020

Ecosystem Expansion 2026

Nationalux Lab Inc.

PUBLIC EDITION — OCTOBER 2026

Contents

1. Executive Summary
2. From the Content Economy to the AI & Data Economy
3. The Problem
4. The Nationalux AI & Data Economy

4.3 Technical Pipeline Architecture

Nationalux is developing a hybrid architecture that separates high-throughput data processing from on-chain settlement and audit references. The following items describe the technical roadmap and should not be interpreted as a statement that every component is already deployed.

Data Indexing & Storage Layer. Dataset metadata and integrity references may be anchored using SHA-256 hashes, with decentralized storage technologies such as IPFS or Arweave evaluated for selected use cases. Sensitive enterprise data may remain within controlled environments. Privacy-preserving verification technologies, including trusted execution environments (TEE) and zero-knowledge proof methods, may be introduced where technically and commercially appropriate.

Access Control & Settlement Layer. Future marketplace modules may use dedicated smart contracts for NNX-based escrow or conditional settlement. Access credentials and decryption keys would remain outside the public blockchain, while signatures, settlement events and transaction hashes may provide verifiable audit references.

AI Agent Consumption API. The roadmap includes REST/gRPC interfaces and signed-transaction workflows for machine-to-machine access to eligible data and AI services. EIP-712 typed-data signatures and NNX-denominated micro-settlement mechanisms may be evaluated as dedicated modules. Production deployment will require separate implementation, security testing and public technical documentation.

5. What Is NNX?
6. One Token, Multiple Economies
7. How NNX Works
8. Data Marketplace

8.5 Verifiable Marketplace Roadmap

The marketplace is intended to evolve toward verifiable dataset registration, access control and settlement. Planned modules include integrity hashing, optional decentralized metadata references, encrypted access delivery, conditional NNX settlement and machine-readable APIs. These modules will be disclosed as implemented; this whitepaper does not represent roadmap components as currently deployed production functionality.

1. Executive Summary

Artificial intelligence is rapidly becoming essential infrastructure for businesses, institutions and digital services. Yet AI cannot create sustainable value without access to usable, trustworthy and appropriately governed data.

Valuable data remains fragmented across companies, institutions, platforms and individual creators. Data providers often lack practical ways to distribute and monetize their assets, while AI developers and enterprises face difficulties discovering, evaluating and accessing suitable datasets.

NNX is an Ethereum-based utility token designed to support access, participation, settlement and rewards across the Nationalux AI & Data ecosystem.

- DATA — Data providers can make eligible datasets available to authorized users and services.
- AI — AI developers and service providers can connect data resources with AI-powered services.
- MEDIA — Creators and users can participate in digital-content and reward ecosystems, preserving the original NNX use case.
- ECOSYSTEM — Enterprises, institutions, developers and users can participate in a common digital economy using NNX as a utility layer.

NNX is not a newly created token for this initiative. NNX was originally deployed as an ERC-20 token on Ethereum Mainnet in 2020. Whitepaper 2.0 expands the original content-oriented concept toward a broader AI and data economy while preserving the existing blockchain history.

2. From the Content Economy to the AI & Data Economy

2.1 The Original NNX Vision

The original Nationalux ecosystem connected creators, viewers, advertisers and the platform through an Ethereum-based token economy. Creators could be rewarded for content, viewers could be rewarded for eligible participation, and commercial participants could use tokens within supported platform services.

Digital contribution should be capable of creating measurable digital value.

2.2 Expansion of Digital Value

Since the original NNX deployment, digital value creation has expanded beyond content. Enterprises generate operational data, users generate digital interaction data, software systems generate machine-readable data, and AI systems increasingly transform these resources into analysis, prediction, automation and new digital services.

Whitepaper 2.0 therefore expands NNX from a content-centered utility into a broader layer connecting data, AI services, digital content and ecosystem participation.

3. The Problem

3.1 Data Exists — But Data Economies Remain Fragmented

The principal challenge is not the absolute absence of data. Useful data is frequently distributed across independent organizations, stored in incompatible structures, difficult to discover, difficult to evaluate, difficult to exchange under consistent conditions, and disconnected from the economic value created downstream.

A company may possess valuable data without a practical commercialization route. An AI developer may possess useful technology while lacking appropriate data. A buyer may discover a dataset but lack sufficient information to judge structure, quality or permitted use.

Data exists, AI exists and demand exists — but they are not efficiently connected.

3.2 The Contribution and Value Gap

The ecosystem is designed to make eligible contributions more visible and auditable. NNX can be used by supported applications as one utility mechanism for access, rewards, participation or settlement, without requiring every service to use an identical commercial model.

4. The Nationalux AI & Data Economy

Nationalux proposes a domain-neutral ecosystem in which data resources, AI services, digital content and participating organizations can interact through common infrastructure.

- Data providers and buyers
- AI developers, agents and service providers
- Enterprises and institutions
- Content creators and digital-media participants
- End users and ecosystem participants

4.1 Domain-Neutral Architecture

NNX is not dependent on maritime, transportation, manufacturing, media or any other single industry. The architecture is intended to support multiple verticals while keeping data rights, commercial terms and service-level rules specific to each application.

4.2 Generalized Data Flow

Raw Data → Semantic Processing → AI-Ready Data → Marketplace → AI Services → NNX Utility

This flow is modular. A service may use only the components that are relevant to its business model.

5. What Is NNX?

NNX is an ERC-20 utility token deployed on Ethereum. Within the expanded Nationalux ecosystem, it is intended to serve as a common utility layer connecting selected digital economic activities.

5.1 Core Utility

- Data Utility — selected data-related access, participation or settlement functions.
- AI Service Utility — selected access to AI services, agents, analytics or digital tools.
- Ecosystem Rewards — defined reward programs for eligible contributions.
- Media & Content Utility — continuation of the original creator/viewer use case.
- Blockchain Settlement Reference — supported applications may associate transactions with an Ethereum transaction hash for auditability.

5.2 What NNX Does Not Represent

NNX ownership does not, by itself, represent shares of Nationalux Lab Inc., ownership of corporate intellectual property, a claim on corporate profits, a guaranteed return, or corporate voting rights. Any separate equity, acquisition or corporate transaction is legally and operationally distinct from NNX.

6. One Token, Multiple Economies

Different forms of digital contribution can participate in one interoperable digital economy.

NNX is designed as a common utility layer rather than a separate token for every service. Applications may retain independent pricing, access conditions, commercial contracts and payment methods.

6.1 Participants

- Data Provider
- Data Buyer
- AI Service Provider
- AI Developer
- Enterprise / Institution
- Content Creator
- Viewer / User
- Platform and ecosystem service operators

6.2 Business Pricing vs. Token Utility

Datasets and services may be priced in conventional units such as USD even where NNX is used for an eligible utility function. This whitepaper does not define NNX as a fiat-backed stablecoin and does not promise a fixed fiat redemption value.

7. How NNX Works

7.1 Utility Flow

A participating service defines an eligible activity such as dataset access, AI-service usage, data contribution, creator contribution or user reward. Where NNX is supported, the service can associate that activity with an NNX transfer, reward, access condition or blockchain settlement record.

7.2 Example Transaction Lifecycle

1. A user selects a supported dataset, AI service or digital service.
2. The application presents commercial terms and access conditions.
3. Payment or settlement occurs through the payment method supported by that service.
4. Where NNX utility applies, an NNX transaction or reward is initiated.
5. The Ethereum transaction hash may be recorded as an auditable reference.
6. The application grants the applicable access or records the completed contribution.

7.3 Conventional Payments and NNX

Conventional payment rails and NNX blockchain transactions are separate technical and commercial events unless a particular service expressly and lawfully connects them. This separation allows conventional commerce infrastructure to coexist with blockchain utility.

8. Data Marketplace

8.1 Purpose

The Data Marketplace concept connects organizations or individuals controlling eligible data with parties seeking data for analytics, AI development and digital services.

8.2 Data Lifecycle

7. Data registration and descriptive metadata.
8. Structure, schema and metadata analysis.
9. Semantic processing and classification where applicable.
10. Preparation of AI-ready or application-ready representations.
11. Catalog publication for eligible users.
12. Commercial access under applicable rights and contracts.
13. Optional NNX utility for selected settlement, reward or participation functions.

8.3 Ownership, Licensing and Access

Listing or processing data does not automatically transfer ownership. Ownership, licensing, permitted use, access duration, privacy obligations and downstream rights must be governed by applicable agreements and law.

8.4 Industry Neutrality

The marketplace architecture is intentionally broad and may support multiple commercial and digital sectors where technically and legally appropriate.

9. AI Service Economy

9.1 From Data to AI Services

Data creates additional value when transformed into analysis, prediction, automation or other AI-enabled services. The NNX ecosystem therefore extends beyond dataset exchange toward interactions between data resources and AI services.

9.2 Participating Services

- AI analysis and prediction
- AI agents and automated workflows
- Data classification and semantic services
- Data preparation and transformation
- Domain-specific AI applications
- Enterprise AI services

9.3 NNX Utility

Participating AI services may define NNX-based access, rewards or settlement functions. Utility may differ by service and does not require uniform pricing.

9.4 Separation of Roles

Data providers and AI providers can participate independently. A data provider need not become an AI developer, and an AI developer need not own all underlying data.

10. Media & Reward Economy

10.1 Continuity with the Original NNX Ecosystem

NNX was originally designed around a digital-content ecosystem connecting creators, viewers, advertisers and the platform. Whitepaper 2.0 preserves media and content utility rather than replacing the original concept.

10.2 Creator and User Utility

Eligible creators may receive NNX-based rewards or use NNX-enabled services. Participating applications may also implement reward programs for eligible user activity, subject to anti-abuse controls and program-specific rules.

10.3 Commercial Participants

Advertisers and other commercial participants may use supported platform services for promotion, access or digital-content opportunities. NNX may be integrated into selected service functions where appropriate.

10.4 Expansion Beyond Video

The media economy may include video, music and other digital media. Media is treated as one component of the broader AI and data economy.

11. NNX On-Chain Status & Tokenomics

11.1 Existing Ethereum Deployment

NNX is an existing Ethereum Mainnet ERC-20 token originally deployed in 2020. Whitepaper 2.0 documents an expansion of utility around the existing token rather than a new token issuance.

11.2 Current On-Chain Reference

Item	Description
Token Name	Nationalux
Symbol	NNX
Network	Ethereum Mainnet
Standard	ERC-20
Decimals	18
Contract Address	0x1a5a018A46Cd4C5C4E04464C44f74B3B10C01D bE
Observed Total Supply	9,999,900 NNX

11.3 Historical Plan vs. Actual Mainnet State

The 2020 Nationalux whitepaper described a planned distribution based on 100,000,000 NNX. The currently observed Ethereum Mainnet supply is 9,999,900 NNX. Whitepaper 2.0 distinguishes the historical plan from the actual on-chain state. The historical figure should not be presented as the current issued or circulating supply.

11.4 Treasury and Circulation

Current State. NNX has a current total supply of 9,999,900 NNX. Confirmed company-controlled holdings total 9,999,829 NNX, while current non-company holdings total 71 NNX. The target initial circulating supply at exchange listing is 1,199,988 NNX (approximately 12%), including existing non-company holdings. This target is not a commitment to sell the entire amount into the market.

Treasury Security Roadmap. Nationalux intends to strengthen treasury custody before material ecosystem distribution. Rather than presenting an unimplemented fixed vesting schedule as a current fact, the project will evaluate on-chain time-lock or vesting contracts for allocations once specific partner, ecosystem, liquidity or reserve distributions are formally approved. Any implemented lock-up contract, beneficiary, amount and release rule should be published with its on-chain address.

Advance Disclosure. Material treasury allocations or material increases in circulating supply are intended to be disclosed before implementation through official project channels, subject to security, legal and operational requirements. A minimum advance-notice period may be established as part of the formal treasury policy after operational procedures are finalized.

11.5 Administrative Functions

Current State. The deployed NNX contract contains minting, burning and pausing functionality. On-chain role checks confirm that the Nationalux-controlled creator/administrative address 0x0d42b0e471C0A702dfe12417e2354cc9F1680A09 currently has both Minter and Pauser authority. The principal treasury address 0xe3621488A974FCA5d39F9e72Afb738F04255412A has neither Minter nor Pauser authority.

Administrative Security Roadmap. Nationalux intends to evaluate migration of administrative authority from a single externally owned account to a multi-signature control structure, such as a Safe-compatible multisignature wallet, after technical verification of role-transfer procedures and operational signers. A target configuration such as 3-of-5 may be adopted only after signers, recovery procedures, legal responsibilities and incident-response processes are formally established. Until such migration occurs on-chain, the current administrative address remains the authoritative role holder.

11.6 No Guaranteed Price or Redemption

NNX has no guaranteed market price under this whitepaper. Nationalux does not state that one NNX equals a fixed amount of fiat currency and does not promise unconditional redemption at a fixed fiat value.

12. Exchange, Liquidity & Scalable Market Development

12.1 Utility First, Market Access Second

NNX is designed to derive relevance from actual ecosystem use rather than from exchange listing alone. Exchange access is treated as infrastructure that can improve transferability and price discovery after utility, governance and disclosure foundations are established.

12.2 Precedent-Based Expansion Model

The preferred growth model follows a pattern seen in successful technology ecosystems: establish one working use case, prove recurring utility, expand to adjacent use cases, add distribution partners, and only then broaden market access. BAT provides a relevant token precedent: it began with a focused browser rewards use case and subsequently expanded utility into creators, wallets, partners and additional Web3 applications. The lesson adopted by NNX is not to copy BAT's economics, but to expand utility progressively from a real product base.

For corporate scaling, the whitepaper also draws on the acquisition-compounding model used by established software groups such as Constellation Software: retain operating specialization, expand organically, add complementary businesses, and repeat the process across additional vertical markets. NNX does not represent equity in acquired businesses; the precedent is used only for ecosystem and corporate growth architecture.

12.3 Market Development Stages

14. Stage 1 — Reactivation: verify the existing contract, treasury, administrative roles and public disclosures.
15. Stage 2 — Utility: connect NNX to selected data, AI and media functions with measurable usage.
16. Stage 3 — On-chain Access: enable compatible self-custody wallet support and, where appropriate, permissionless decentralized liquidity.
17. Stage 4 — Exchange Applications: apply to suitable centralized trading platforms based on legal, technical, security and liquidity readiness.
18. Stage 5 — Institutional Expansion: add enterprise participants, data groups and ecosystem partners without making exchange speculation the core business model.

12.4 Liquidity Principles

- Liquidity should support genuine transfer and utility rather than artificial volume.
- Nationalux should not guarantee token price, minimum return or fixed redemption.
- Treasury and liquidity-wallet movements should be governed by documented internal controls.
- Market-making or exchange relationships, if used, should be documented and compliant with applicable law and platform rules.
- Material token-supply changes should be disclosed before implementation where legally and operationally appropriate.

13. Governance

13.1 Corporate Governance Is Separate from NNX

NNX token ownership and Nationalux corporate voting rights are separate.

Holding NNX does not grant voting rights in Nationalux Lab Inc., rights to elect directors, rights to dividends, rights to corporate assets, or authority over acquisitions, financing or other corporate decisions.

13.2 Ecosystem Participation

Nationalux may introduce non-binding ecosystem participation mechanisms for matters such as service priorities, community proposals, reward-program feedback or technical integration preferences. Such mechanisms do not replace the legal authority of the board, officers or shareholders.

13.3 Administrative Controls

Contract administration, treasury custody and operational permissions should be governed through documented authorization procedures. As the ecosystem scales, Nationalux may adopt multi-signature custody, role separation, transaction limits, independent review or other controls appropriate to the risk profile.

13.4 Transparency

- Publish the verified token contract and material token information.
- Disclose current supply and material treasury policies.
- Separate corporate announcements from token-market communications.
- Identify material changes to utility, administrative authority or distribution policy.
- Avoid language implying guaranteed appreciation, returns or corporate ownership.

14. Growth, Data Network Expansion & Roll-Up Strategy

14.1 Initial Position: Token Reactivation and Data Network Formation

The first phase begins with the existing NNX token and a limited set of functioning ecosystem services. Nationalux will connect independent data groups through common catalog, semantic, AI-service and settlement interfaces while preserving the commercial identity and rights of each participant.

14.2 Data Groups as Independent Economic Nodes

Each participating data group can retain its own domain knowledge, customers, datasets, pricing and contractual rules. The common layer focuses on interoperability, discovery, AI-service connectivity and selected NNX utility.

14.3 Expansion Flywheel

Connect → Standardize → Create Utility → Grow Revenue → Add Companies → Add Data → Repeat

19. Connect independent companies and data groups to the ecosystem.
20. Standardize only the interfaces required for discovery, exchange and AI use.
21. Create measurable utility through data transactions, AI services and digital participation.
22. Increase recurring commercial activity and ecosystem density.
23. Identify complementary companies with valuable data, software, customers or domain expertise.
24. Where strategically appropriate, pursue partnerships, investments or corporate acquisitions separately from NNX.
25. Preserve useful operating specialization while connecting acquired or affiliated data assets to the broader ecosystem.
26. Repeat the process across additional industries and geographies.

14.4 Roll-Up Architecture

The roll-up strategy is a corporate growth strategy, not a token-governance mechanism. A company joining the Nationalux group through an acquisition, share exchange, asset acquisition or other corporate transaction does not automatically receive rights through NNX, and NNX holders do not automatically receive rights in the acquired company.

The strategic objective is to aggregate differentiated data assets and specialized operating capabilities while maintaining decentralized domain expertise. This resembles proven vertical-software acquisition models in which operating units retain market specialization while a parent group provides capital allocation, shared infrastructure and strategic support.

14.5 Corporate Transactions and Data Assets

Where Nationalux acquires property or a business using shares, cash or other lawful consideration, the transaction should be separately valued, approved and documented under the corporate law applicable to Nationalux and the target. Under the Canada Business Corporations Act, for example, shares may be issued for money, property or past services where the statutory consideration requirements are satisfied. British Columbia's Business Corporations Act similarly recognizes money, property and past services as consideration for fully paid shares. The applicable statute depends on the corporation and transaction.

14.6 Long-Term Target State

The long-term objective is a network of independently valuable data and AI businesses connected by interoperable infrastructure. Growth is expected to come from both organic adoption and disciplined corporate

expansion. NNX functions as a utility layer within eligible services; it is not the acquisition currency or legal ownership layer unless a future structure is separately designed, reviewed and disclosed in compliance with applicable law.

15. Risk Factors

Crypto assets, digital marketplaces, AI services and corporate expansion involve material risks. This section follows the disclosure principle used by established crypto projects and Canadian regulatory guidance: risks should be stated plainly rather than minimized.

15.1 Token Price and Liquidity Risk

NNX may experience substantial price volatility, limited liquidity, wide bid-ask spreads or periods with no meaningful market. Exchange listing or liquidity is not guaranteed.

15.2 Utility Adoption Risk

The value of the ecosystem depends on real adoption by data providers, AI providers, enterprises, creators and users. Planned utility may be delayed, changed or discontinued.

15.3 Smart Contract and Blockchain Risk

NNX depends on Ethereum and its surrounding infrastructure. Smart-contract vulnerabilities, administrative-key compromise, network congestion, gas costs, wallet errors, forks or protocol changes may affect use.

15.4 Custody and Cybersecurity Risk

Loss or compromise of private keys can result in irreversible loss of control over tokens. Treasury, operational and user wallets are also exposed to phishing, malware, social engineering and infrastructure attacks.

15.5 Regulatory Risk

The legal characterization of a crypto asset depends on its facts, distribution and use. A token described as a utility token may still be a security or derivative in Canada if the overall arrangement satisfies applicable legal tests. Regulatory expectations can change.

15.6 Exchange and Counterparty Risk

Centralized exchanges, custodians, market makers, payment providers and other counterparties may suspend services, become insolvent, change eligibility rules or experience security failures. Listing on any platform is not guaranteed.

15.7 Data Rights, Privacy and AI Risk

Data commercialization can involve privacy, intellectual-property, confidentiality, licensing, cybersecurity and cross-border-transfer obligations. AI outputs may be inaccurate, biased or unsuitable for a particular use. Participation in the NNX ecosystem does not eliminate these obligations.

15.8 Roll-Up and Integration Risk

Acquisitions can fail to create expected value because of valuation errors, integration problems, customer loss, technology incompatibility, financing constraints, cultural differences or regulatory approvals. Nationalux may choose not to complete a proposed transaction.

15.9 Market Conduct Risk

Artificial volume, misleading promotion, undisclosed conflicts or manipulative trading can harm participants and expose parties to legal or exchange enforcement. Nationalux's intended policy is to prioritize genuine utility and transparent disclosure.

15.10 No Assurance of Returns

There is no assurance that NNX will appreciate in value, maintain liquidity, obtain exchange listings or generate any financial return. Participants should not rely on this whitepaper as a promise of profit.

16. Canadian Legal & Regulatory Framework

16.1 Purpose of This Section

This section is a high-level compliance framework for a Canadian issuer and ecosystem operator. It is not a legal opinion. Final token distribution, exchange access, payment, custody, acquisition and marketing structures should be reviewed by qualified Canadian counsel for the applicable province and business activity.

16.2 Securities Law: Substance Over Label

Canadian Securities Administrators guidance states that calling a token a 'utility token' does not determine its legal status. A token offering may involve securities or derivatives depending on the totality of the arrangement, including whether purchasers are investing with an expectation of profit derived significantly from the efforts of others.

Accordingly, NNX should be presented around functioning utility and accurate disclosures, not promises of appreciation. Any public sale, fundraising transaction, distribution program or exchange strategy should be separately assessed under applicable provincial securities law before launch.

16.3 Crypto Trading Platforms

Canadian securities regulators regulate crypto-asset trading platforms in circumstances where securities, derivatives or crypto contracts are involved. Platform registration status and Canadian-client eligibility should therefore be checked before Nationalux represents any centralized trading venue as available to Canadian users.

16.4 Virtual Currency and FINTRAC

FINTRAC treats the business of exchanging funds for virtual currency, virtual currency for funds, virtual currency for another virtual currency, and certain virtual-currency transfer services as dealing in virtual currency. A Canadian business carrying on those activities may be required to register as a money services business and comply with applicable AML, identity-verification, record-keeping and reporting obligations.

For that reason, Nationalux should distinguish between selling its own goods or services, using NNX as an ecosystem utility, and operating an exchange, redemption or client-transfer service. Features that convert fiat to NNX, redeem NNX for fiat, or transfer virtual currency on behalf of clients require separate compliance analysis.

16.5 Avoiding Unintended Stablecoin Characterization

Whitepaper 2.0 does not define NNX as maintaining a fixed value against CAD, USD or another asset. Nationalux does not promise a 1:1 fiat reserve or fixed redemption. Canadian regulators apply additional conditions to value-referenced crypto assets traded through regulated crypto platforms, making this distinction material.

16.6 Corporate Roll-Ups and Share Consideration

NNX governance remains separate from corporate ownership. Acquisitions or roll-ups should be completed through ordinary corporate instruments and agreements. Where shares are issued for property, services or other permitted consideration, the transaction must satisfy the corporate statute governing the issuing corporation and directors' duties, valuation and approval requirements.

Under section 25 of the Canada Business Corporations Act, shares may be issued for money, property or past services if the statutory fair-equivalent requirement is met. Under section 64 of British Columbia's Business Corporations Act, fully paid shares may similarly be supported by money, property or past services where the required value is received. These provisions do not by themselves resolve securities, tax, valuation, related-party or exchange-listing requirements.

16.7 Compliance-by-Design Principles

- Keep NNX utility separate from corporate equity and voting rights.
- Do not promise fixed fiat redemption, guaranteed returns or token-price appreciation.
- Verify securities-law treatment before any fundraising or broad public token distribution.
- Assess FINTRAC/MSB obligations before providing exchange, redemption or client-transfer services.
- Use KYC/AML controls where required by the activity and counterparty.
- Maintain records of treasury movements, material token distributions and administrative authority.
- Use clear data-licensing, privacy and IP terms for marketplace transactions.
- Use qualified Canadian legal, tax and accounting advisers before implementing roll-ups or public-market transactions.
- Check the regulatory status of trading platforms before marketing access to Canadian users.

16.8 Whitepaper Status

This whitepaper is an informational description of the proposed NNX ecosystem and its development direction. It is not a prospectus, offering memorandum, investment recommendation, promise of future value or legal opinion. Features, timelines and integrations may change in response to technical, commercial, regulatory or security considerations.

Final NNX Disclosure Summary

Issuer / Project Operator: Nationalux Lab Inc.

Company Address: Suite 318 – 1199 West Pender Street, Vancouver, British Columbia V6E 2R1, Canada

Email: kmat0@nationalux.cate24.com

Issue / Deployment Date: January 29, 2020, 00:13:20 UTC

Current Total Supply: 9,999,900 NNX. This is not represented as a hard maximum supply because the deployed contract retains mint functionality.

Confirmed Company-Controlled Holdings: 9,999,829 NNX. Current Non-Company Holdings: 71 NNX.

Target Initial Circulating Supply at Exchange Listing: 1,199,988 NNX (approximately 12%), including existing non-company holdings. This is not a commitment to sell the entire amount into the market.

Ecosystem Allocation Framework

Purpose	Share	Maximum Allocation
Data & Ecosystem Rewards	35%	3,499,965 NNX
Strategic Data Partners	25%	2,499,975 NNX
Exchange & Liquidity	15%	1,499,985 NNX
AI Service & Developer Incentives	10%	999,990 NNX
Long-Term Treasury Reserve	10%	999,990 NNX
Media & Creator Rewards	5%	499,995 NNX

The allocation percentages establish purpose-based maximum pools. Individual partners, recipients, vesting periods and lock-up conditions are not predetermined and will be defined when applicable partnerships or programs are established.

Smart Contract Authority

Administrative / Creator Address: 0x0d42b0e471C0A702dfe12417e2354cc9F1680A09 — Minter: YES; Pauser: YES.

Principal Treasury Address: 0xe3621488A974FCA5d39F9e72Afb738F04255412A — Minter: NO; Pauser: NO.

No additional NNX issuance is currently scheduled. Existing treasury holdings are intended to be used before additional issuance is considered. Any material future issuance is subject to formal Nationalux Lab Inc. approval and prior public disclosure.

Release Policy

NNX does not currently adopt a predetermined time-based unlock schedule. Treasury tokens are allocated progressively in connection with actual ecosystem activity. Material treasury allocations or material increases in circulating supply will be disclosed in advance.
